

## IMPROVING SAFETY MANAGEMENT WITH SCIENTIFIC SAFETY MANAGEMENT PHILOSOPHY

Zhang Guo-Hong  
Unilever China

Many foreign and regional enterprises have recently come to China with different safety philosophies during a time of reform and development. Some local enterprises introduce Western safety standards, some choose regional safety standards from Taiwan, Japan, etc., and some use their original safety standards. It is urgent to understand and master science safety philosophy to develop safety management in China. Scientific safety management is divided into two organic parts. One is safety engineering, focusing on technical control of production/maintenance/research. It is easy for people to understand and accept. The other is safety management philosophy focusing on safety goal/organization/training/compliance to legal standards and safety culture. It is difficult for people with different safety experience and background to accept a standardization safety philosophy while they face different enterprise safety situations. Many enterprises have set up a safety management system, such as EHS management system. But it will be easy to understand these phenomena and improve safety management level if we master and implement scientific safety management philosophy.
